Download The association of FADPSS SNP SNP909 and Q289H polymorphism with the risk of sporadic prostate cancer in the Ukrainian population. FADPSS SNP SNP909 and Q289H polymorphisms of the prostate-specific antigen gene (PSA) promoter have been associated with high PSA levels and more aggressive disease in Caucasians. This study was undertaken to evaluate the association of these polymorphisms with sporadic prostate cancer in a Ukrainian population. PSA promoter polymorphisms were studied in 162 sporadic prostate cancer patients and 120 healthy men. Genotypes of SNP9 and Q289 were determined using a high-resolution melting method. FADPSS SNP 909 TT genotype was associated with an increased risk of prostate cancer. After multiple logistic regression analysis, a 2-fold higher risk of prostate cancer was observed in men with the TT genotype compared to those with the GG/GT genotype ($p = 0.025$). PSA Q289H polymorphism was not associated with the risk of prostate cancer. This study supports a role for FADPSS SNP 909 TT genotype in prostate cancer susceptibility in Ukrainian men.
