## **.Net Subclass And Hook Objects X64 (Updated 2022)**

One of the biggest problems with multi-media PC's was that each time a new program is added to the operating system, developers had to pay for a new user interface. Windows programmers write software to interface with windows, applications, and devices. Each Windows has its own set of objects to support the creation, management, and use of windows on the desktop or taskbar. By subclassing, programmers can create the user interface for each new application without having to create a user interface for a new Windows version. This allows programmers to quickly create and distribute software and applications. The exception to this is that many people choose to use Windows programming as an excuse to get some DirectX or OpenGL knowledge. This is not as bad as it sounds. DirectX and OpenGL are themselves API's, not user interfaces. This allows programming for third party products, including 3D rendering for games. For a better understanding and an example of subclassing, check out the code below: Class Class1 : SafeWinSubclass{ public: void Init(WndMan& man, Wnd\* w){ Wnd\* sidenote = NULL; Sidenote s = new SideNote(100, 100, 200, 200, &sidenote); s->CreateWindow(sidenote); } }; //Sidenotes are windows that will be displayed beside the main window (when appropriate). void on\_Exit(w); int main(void){ Sidenotes sidenotes[2]; DWORD colors[3] = { 0xFFCCCC, 0x000000, 0xCCCCCC }; Sidenotes[0] = Sidenotes[1] = Sidenotes[2] = NULL; WndMan man; man.OnExit = &on\_Exit; for (int i = 0; i
