Papyrus is a portable, high performance language toolkit written in Java. Papyrus is primarily designed for use by language pedagogical linguists, applied linguists, and researchers of language and society. However, Papyrus is a general-purpose programming toolkit that is also useful for application development in a range of fields. Features of Papyrus: Language pedagogical linguists and applied linguists need to perform a variety of computational tasks to support their research. Papyrus includes language analysis and debugging tools. Papyrus can be used to support training, which is an essential component of language pedagogy. These tasks may include text-corpus processing, sentence parsing, or recognition. Other tasks may involve: analyzing or comparing large amounts of linguistic data, such as corpora or dictionary data, to identify the linguistic structures underlying a set of texts; statistical analyses of language use and change, including phonological and morphological analyses, quantitative measures of frequency, and corpus analyses of particular data types such as newswire, speech or colloquial data; generating word or phrase lists, and presenting word-list data in a variety of ways; collating and sorting linguistic data; generating grammatical descriptions, such as syntactic trees, from corpora; conducting word frequency analyses; editing corpora; carrying out morphological analyses on language samples; analyzing morphological data to extract linguistic structures, such as nouns, verbs, adjectives, adverbs, or prepositions; comparing corpora; documenting language acquisition through corpora. Papyrus supports a range of methods for carrying out these tasks. Although Papyrus is a general-purpose programming toolkit that can be used for a range of tasks, it is mainly designed for use by language pedagogues, applied linguists, and researchers. Language pedagogues need to perform a range of tasks to support their teaching. One of the most

It provides a set of robust tools to create, simulate, and analyze models, built using the Eclipse framework. Documentation for using Papyrus with Eclipse P2 - Just what you need to get started with Papyrus. Please Help! Hi all, I installed Papyrus onto a new machine but I can't seem to find the Papyrus software. Please help! I looked under "my Eclipse" and there's nothing there. Thanks in advance. I'm trying to import an old P2 project I had. I cannot find where the old p2 files are, I have Eclipse installed, and it still doesn't show up in "my Eclipses" under "Java EE". Any help would be great! Regards, Peter Eclipse P2 Documents Eclipse P2 is a collection of plugins for Eclipse that support the Model-driven development process. P2 was originally written as part of the popular Spring IDE in the Eclipse.org incubator and is now available as a standalone offering. The one that was given to me was Eclipse Papyrus. Papyrus OFFICE is a powerful application that provides word-processing with everything you need. Main features · Papyrus OFFICE offers integrated word-processing (Papyrus WORD) with a powerful database (Papyrus BASE). Database forms and generated reports are Papyrus WORD documents, and can be re-formatted with ease. · Similarly, form letters can be generated by combining a Papyrus WORD document with a Papyrus BASE database. This technique also permits automated literature indices for bibliographies. · Concise and efficient coding leaves Papyrus plenty of resources to manage huge documents (with thousands of pages!) and equally large numbers of embedded graphics, without requiring an over-dimensional system. · Discontinuous text marks: with Papyrus, you can mark multiple (separate) regions in your document. With this feature, you can make parallel changes to separate regions all at once. You can even use "drag & drop" with discontinuous blocks. · Our full-text database search engine provides immediate results to a query, narrowing the answer with each change to the expression (even as you type each letter). · The "phonetic search" option gives you the ability to find names or other text in a database,

even if you aren't sure of the correct spelling. · Non-modal dialogs: unlike most programs, Papyrus dialogs are "non-modal", meaning that the dialog does not need to be "closed" before you return to your text. Feel free to leave a frequently-used dialog open and ready for use while you continue to type. This also makes it possible to switch back and forth between dialogs when changing formatting or settings. · Papyrus BASE uses a reliable and robust XML-format to store data, allowing multiple (networked) users to operate on (and change) a single database all at the same time. · Papyrus OFFICE is a self-contained executable, permitting it to run even from (fast) removable media (such as USB-memory sticks). Papyrus Benefits: Papyrus Benefits: Flexibility and Control Papyrus provides an efficient word-processing environment where you can easily control formatting, layout, fonts, and other features. Because Papyrus is a tightly integrated suite, editing and formatting a word-processing document is as simple as clicking a button or selecting a style. The Power of Connections Papyrus is designed to be used with databases. Database documents can be integrated into the word processing environment, resulting in a document that has a seamless feel. Database documents can contain graphics, forms, charts, and even printable labels. Database documents can also
