"I am really impressed by your product, it's a real pleasure to have a quality software at a reasonable price. I thank you and hope we will continue to work together in the future. - Philippe " "I really appreciate the free trial version. I know this software well and it is very useful. I am very glad that you provide this free trial version." - Stan "Flow bifurcation of a flexible bilayer membrane: an experimental study. A three-dimensional flexible bilayer membrane is studied experimentally, using a versatile and accurate measurement technique based on the use of a focused femtosecond laser. With a proper choice of the parameters, the membrane self-assembles in a single equilibrium state, and this state can be used as a point of reference for the experimental study of its dynamical behavior. We show that, in contrast with the classical flow bifurcation of planar membranes, the bilayer membrane exhibits a more complex behavior. A linear response and a Hopf bifurcation are observed and the respective stability regions are determined experimentally. As the dimensionless area of the membrane varies, both the characteristic flow time and the characteristic wavelength vary. The results are discussed in the framework of the phenomenological approach introduced by Nedderman and Chen (2007 Phys. Fluids 19 3688).Q: CSS positioning button in container I have a container which I would like to fill the whole page and inside of this container is a box which has a fixed height and

GitHub Repository: ----- effects of sleep and consumption on food intake. Models that attempt to explain variation in sleep duration by including a variable (either socio-economic status or health) in addition to sleep duration can explain between one-quarter and half of the variance in total sleep duration, but there is an unexplained remainder. This suggests that a third variable must exist. In this paper we investigate the idea that sleep duration may be affected by the quality of sleep. This can be measured by the number of times the person sleeps and awakes, the length of time spent awake between sleep bouts, and the length of time spent asleep. We found that the models that include socio-economic status, health, and a variable measuring the quality of sleep were a significant improvement on the model that includes only socio-economic status and sleep duration. This suggests that the unexplained remainder is explained by the quality of sleep.
